

AI Usage DISCLOSURE FORM

1. Team Details

Team Name: Update (TIET_Update)

Project / Product Name: Teachable Voice Automation (Theme 03, Samsung PRISM GenAI Hackathon 2026)

Organization / Institution (if any): Thapar Institute of Engineering and Technology (TIET), Patiala

Submission Date: 30 September 2026

2. AI Usage Declaration

Did your team use any Artificial Intelligence (AI) in developing this project? **Yes**

Two uses. (1) Building the project: Claude (Anthropic), used through Claude Code, as a coding, writing and testing assistant. (2) Inside the app: the open-weight model gpt-oss-120b, served by Fireworks AI, which the app calls while it runs. No other AI tools were used.

3. Purpose of AI Usage (Brief Details)

Idea generation / brainstorming: Yes. Claude, to discuss approaches (values learned from the words of the command that reappear on screen, a fast path with no model for screens already seen, stopping before payment). The problem, the target apps and the final design choices were the team's.

Code generation or assistance: Yes. Claude (Claude Code) wrote and edited the Kotlin app, the adb test scripts and the presentation generator from the team's instructions; the team reviewed the changes and tested them on real phones. Every commit Claude contributed to carries a "Co-Authored-By: Claude" line.

UI / UX design: Yes. Claude proposed the on-screen status pill, the red teaching border, the learned-task list and the slide layouts on the organisers' template; the team chose and adjusted them.

Content creation: Yes. Claude drafted the README, the architecture and evaluation write-ups, the presentation text and the demo-video script; the team edited them. The demo video itself is the team's own recording.

Data analysis: Yes. Claude wrote scripts that tabulate the app's run logs (outcome, time, model calls) for the evaluation tables. Every number comes from real runs on the phone.

Testing / debugging: Yes. Claude ran test commands over adb on the team's Android phone, read the app's logs and fixed failures; the team ran the live tests.

Other: In the product. The app calls gpt-oss-120b (OpenAI's open-weight model, served by Fireworks AI) to turn a demonstration into a reusable task, to understand reworded commands and changed values, and to choose one action on a screen it doesn't recognise. It receives the command as text and a text list of the buttons and labels on screen; no screenshots or audio are sent.

4. Feature Origin Classification (Please add/delete based on the number of the feature)

Feature 1

1. Feature Name: **Teach by demonstration (recording the taps)**

2. Self-Generated/AI-Generated/Both: **Both**

3. Description (AI tools/platform used, prompt used, output summary, modification): AI tool: Claude (Claude Code). Instruction (summarised): record every tap, typed text and back press while the user shows a task once, including on screens that don't report taps, and ignore taps in other apps (a call, the notification shade). Output: the recorder, with a tap-capture overlay and a snapshot of the screen for every tap. Modification: reworked after tests on the phone (Jetpack Compose screens, web views, detours into other apps).

Feature 2

1. Feature Name: **Generalisation into a reusable task**

2. Self-Generated/AI-Generated/Both: **Both**

3. Description (AI tools/platform used, prompt used, output summary, modification): AI tools: Claude (Claude Code) wrote the rule-based generaliser: words of the command that reappear in what was typed or tapped become values such as {restaurant} and {item}. When a task is learned, gpt-oss-120b on Fireworks AI refines it once ("refine" prompt in llm/Brain.kt: name the values, describe each step, mark stray taps as not needed). Output: a task stored as steps in plain words with values. Modification: on 30 Sep, fixed for dish names the speech recogniser mishears and for ADD buttons whose own box does not name the dish.

Feature 3

1. Feature Name: **Understanding voice commands**

2. Self-Generated/AI-Generated/Both: **Both**

3. Description (AI tools/platform used, prompt used, output summary, modification): Speech to text: Android's speech recogniser. AI tools: Claude (Claude Code) wrote the offline matcher for exact and template commands; reworded commands, changed values and missing values go to

gpt-oss-120b on Fireworks AI ("match" prompt in llm/Brain.kt), which returns the task and its values as JSON. Output: 18/18 on the Amazon test set, median 1.1 s. Modification: rules for quantities and misheard words added after tests.

Feature 4

1. Feature Name: **Replay engine**

2. Self-Generated/AI-Generated/Both: **Both**

3. Description (AI tools/platform used, prompt used, output summary, modification): AI tools: Claude (Claude Code). Instruction (summarised): replay the steps on a changed screen without the model where possible. Output: a scored element matcher (fast path, no network) and an executor that scrolls and searches the page before asking gpt-oss-120b for a single action ("act" prompt in llm/Brain.kt). Modification: many rounds from tests on the phone (sponsored results, an item already in the cart, pop-ups, a restaurant it was not taught on).

Feature 5

1. Feature Name: **Asking the user, and stopping before payment**

2. Self-Generated/AI-Generated/Both: **Both**

3. Description (AI tools/platform used, prompt used, output summary, modification): The rules came from the theme and the team: never pay, never act on login, OTP or password screens, and ask when a value is missing. AI tool: Claude (Claude Code) implemented the guard (checked on every action), the spoken questions, the "Your turn" hand-back and the "Next" button on the hand-back pill. Modification: wording and common Hindi payment and login phrases added after tests.

Feature 6

1. Feature Name: **The same task in another app (Amazon to Myntra)**

2. Self-Generated/AI-Generated/Both: **Both**

3. Description (AI tools/platform used, prompt used, output summary, modification): AI tools: Claude (Claude Code) extended the executor so that a task taught on Amazon runs on Myntra; there gpt-oss-120b finds the equivalent buttons ("Add to Bag"). Adverts are skipped, and sizes are asked for, never chosen. Output: 7/7 runs on Myntra. Modification: advert detection and bag-count checks added after tests.

Feature 7

1. Feature Name: **Documentation, presentation and demo video**

2. Self-Generated/AI-Generated/Both: **Both**

3. Description (AI tools/platform used, prompt used, output summary, modification): AI tool: Claude. It drafted the README, docs/architecture.md and the evaluation write-ups, and generated the 12-slide presentation with python-pptx on the organisers' template; the team reviewed and edited them. The demo video is the team's own recording in one take; Claude wrote the shot list and trimmed only its start and end.

5. Ethical & Compliance Confirmation

AI usage complies with guidelines and policies. **Yes**

No proprietary or copyrighted data misused. **I Agree**

6. Declaration & Sign-Off

Name of Team Representative: Shikhar Goel

Role: Team representative; B.E. Computer Engineering, 3rd year, TIET

Signature: *Shikhar Goel*

Date: 30 September 2026
